IncapttaPro — Session Summary

19 March 2026 | All Changes & Fixes

Fund transfer cards in the manager app had the wrong colour (blue) and lowercase account names — transfers were not visible to managers.

- **Fixed:** incaptta-manage/src/views/Approvals.vue
  - – Changed transfer card accent colour: blue !' red (border-l-red-500, bg-red-500/15, text-red-500)
  - – Uppercased account labels: fromAccount / toAccount !' .toUpperCase()

OPEX line items had no way to attach supporting documents per entry. Only a single top-level attachment field existed for the entire expense.

- **Added:** project-management/src/features/operationalExpenses/pages/OpexDetail.vue
  - – Attach button (UploadCloud icon) on every line item in the read-mode table
  - – Files uploaded to Firebase Storage via uploadExpenseAttachment
  - – Attachment sub-rows display: filename, file size, upload date, uploaded-by user, remove button
  - – Stored in Firestore as items[n].attachments: [{ url, name, size, uploadedAt, uploadedBy }]
  - – TypeScript index cast fixes applied (itemFileInputRefs, itemUploading typed as any to handle v-for idx)

Adhoc expenses marked isAdjustment: true (post-invoice adjustments that erode TWID profit) were approved on job cards but: (a) never written to the operationalExpenses collection, so the ledger was blind to them; (b) even after the write was fixed, they appeared identical to regular expenses with type: EXPENSE.

- **Fixed:** Four files updated:
  - JobCardDetail.vue — both the individual-item and approve-all approval paths now pass category: "job-card-adjustment" when calling recordExpense()
  - financeStore.ts — updateLedger() maps category === "job-card-adjustment" !' type: "ADJUSTMENT" instead of "EXPENSE"
  - LedgerView.vue — added <SelectItem value="ADJUSTMENT"> to the type filter dropdown
  - OpexList.vue — job-card-adjustment category badge now renders in red (text-red-500) instead of brand colour

- **Found:** 17 adjustment expenses across 3 job cards (JC-2026-0137, JC-2026-0128, JC-2026-0138) were approved BEFORE the ledger-write code existed. They had no operationalExpenses documents at all — invisible to the ledger and account balances.
- **Created:** migrate-adjustment-expenses.mjs (Firebase Admin SDK script at project root)
  - – Dry-runs by default; pass --apply flag to write to Firestore
  - – Reads all jobCards, finds adHocExpenses with isAdjustment: true AND approvalStatus: APPROVED_MANAGER
  - – Deduplicates against existing operationalExpenses docs (description prefix + amount within $0.01)
  - – Back-filled all 17 missing entries with category: "job-card-adjustment", isAdjustment: true, status: "APPROVED", source: "migration-backfill"
  - – Entries now appear in the ledger with type: ADJUSTMENT and the correct account balance impact

The isLockedAgainstPdf mechanism already existed (lockApprovedItems store function + PDF filters) but had 3 critical bugs that broke the guarantee:

#	Bug	Consequence
1	PDF not awaited before lock	If PDF crashed mid-way, items were permanently locked — no retry possible for the user
2	No loading state on buttons	Double-clicking fired two simultaneous lock operations on the same items
3	hasApprovedInventory missed requisitionSections	Download button stayed hidden even when section-based approved items existed

- **Fixed in:** project-management/src/features/jobCards/pages/JobCardDetail.vue
  - – Added isLockingInventory & isLockingExpenses refs — buttons disabled and show spinner during download
  - – await generateApprovedRequisitionPdf(...) — lockApprovedItems() only called after confirmed PDF success
  - – hasApprovedInventory now checks requisitionSections as fallback when flat requisitionItems is empty

- **Git commit:** 3d6ff01 — 82 files pushed to main branch

- **Firebase deploy:** https://incaptta-pro.web.app (hosting:main, deployed twice in session)
- **Migration:** node migrate-adjustment-expenses.mjs --apply — 17 ledger entries created in Firestore
